

C069 — Process narrative

Altura Infra Holdings Limited · FY 2025-26 (1 April 2025 – 31 March 2026) · Procure to Pay · Three-way match before payment authorisation

Purpose

This narrative describes how a vendor invoice is matched against its purchase order and goods receipt note before it can be released for payment, and the points at which the control operates.

The process

1. A purchase order is raised in SAP S/4HANA and released once approved per the delegation-of-authority matrix.
2. Goods or services are received and a goods receipt note is recorded by stores against the purchase order.
3. The vendor invoice is received into the AP inbox and keyed against the purchase order.
4. On posting, the system performs a three-way match of invoice, purchase order and goods receipt note on quantity and price.
5. Where the three agree within the configured tolerance, the invoice posts and becomes available for the payment run.
6. Where a variance exceeds tolerance, the system blocks the invoice, records an exception and routes it to the buyer named on the purchase order.
7. A blocked invoice cannot enter a payment run until the exception is cleared or an override is approved.

Where the control operates

The control is automated and preventive. It operates at the point of invoice posting, on every PO-based invoice, and cannot be bypassed by a user: the block is enforced by configuration, not by procedure.

Systems and roles

SAP S/4HANA (client PRD 100). AP Executives key invoices; AP Managers clear exceptions; tolerance configuration is held by IT Applications under change control. No single role can both key an invoice and amend the tolerance.
