

C069 — Walkthrough

Altura Infra Holdings Limited · FY 2025-26 (1 April 2025 – 31 March 2026) · Procure to Pay · Three-way match

Control	Three-way match before payment authorisation
Walked on	2026-04-10
Performed by	A. Jain, Audit Senior
Attended by	AP Manager, Head of Accounts Payable
Transaction walked	INV-2631013 · PO-264107 · Tata Power Solar Systems Ltd

What we did

We selected one transaction from the period and followed it from the raising of the purchase order through to the release of payment, observing the control operate and inspecting the evidence it leaves at each point. The transaction walked was invoice INV-2631013 for Tata Power Solar Systems Ltd, value INR 40.12 lakh, against purchase order PO-264107 and goods receipt note GRN-268205.

What we observed, against each design check

1. The match is enforced by the system and cannot be bypassed by a user

We attempted to post invoice INV-2631013 without a goods receipt note in the test client. The system blocked the posting with message M8 147. No user role in the AP team carries the authority to release that block.

Conclusion: operating as designed

2. The tolerance the match operates at is documented and approved

Tolerance key PP is set at 5% capped at INR 25,000, per the configuration extract. The tolerance is recorded in the approved AP policy at section 6.3 and was last changed on 12 March 2024 under change ticket CHG-88412.

Conclusion: operating as designed

3. A held invoice cannot be released without an approved override

We inspected exception EX-26210. The invoice remained blocked from the date it was raised until the buyer confirmed the revised price. No payment run included it while it was held.

Conclusion: operating as designed

4. The control leaves an audit trail showing it ran on each invoice

The SAP change log records the match result against each invoice document. We traced the sampled invoice to its log entry and agreed the match result and the timestamp.

Conclusion: operating as designed

Conclusion

The control is designed effectively to address the risk. The walkthrough confirmed that each design check operates as described, and that the control leaves sufficient evidence for a reviewer to establish that it ran.
