

C070 — Process narrative

Altura Infra Holdings Limited · FY 2025-26 (1 April 2025 – 31 March 2026) · Procure to Pay · Duplicate invoice detection

Purpose

This narrative describes the system check that prevents the same vendor invoice being captured and paid twice, and the review of any override of that check.

The process

1. On entry, SAP checks the combination of vendor, invoice number, amount and invoice date against invoices already posted.
2. Where all four agree to an existing document, the invoice is blocked as a suspected duplicate.
3. A block can be overridden only by a user holding the override authorisation.
4. Every override is written to the audit trail with the user, timestamp and reason.
5. The AP Lead reviews the override report monthly.

Where the control operates

Automated and preventive at the point of entry, with a detective review of overrides after the fact.

Known limitation

The duplicate check compares the invoice number as keyed. A vendor invoice re-keyed with a leading zero, a different case, or additional whitespace will not match an existing document and will not be blocked.
